

The OxyScan Transmitter is a measuring amplifier for UMS oxygen sensors to measure dissolved oxygen in liquids.

The liquid temperature and the atmospheric pressure are measured simultaneously and automatically compensated.

The measured value is output as a current signal via a 4-20 mA current loop. There is no need for additional electric power.

## Handling of the O2 sensor (electrochemical)

Always store the sensor in its calibration chamber when not in use!

The membrane (thin, be careful) at the sensor tip can be cleaned carefully with a moistened cotton ball.

A constantly increasing display value indicates a damaged membrane. In this case, the sensor must be replaced or regenerated.

The sensor consumes minimal amounts of O2 during the measurement. Therefore it requires a little liquid flow to achieve stable readings.

For measurements in standing liquids, the sensor should be moved slightly.

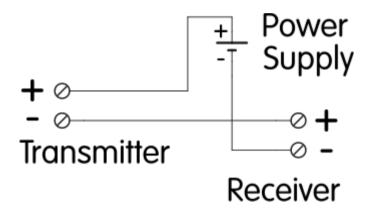

For permanent installation in piping systems: The liquid flow rate should be at least 2 cm / sec. The sensor may be mounted vertically to horizontally, but the sensor tip must not be higher than the sensor end!

#### Commissioning

The UMS oxygen sensor is connected to the lower terminals: <sup>mg/I</sup> ⊖ Para <sup>%Sat</sup> ⊖ meter O Error C: White Param. Cal. A: Blue Select Press Press NTC1: Black + Yellow/Green long (3 s) short NTC2: Brown DO-Transmitter loop powered Power is supplied through the niaue current loop at the upper terminals Measuring Systems (+ / -). С Ø Δ NTC1 NTC2 **GND** 

In case the transmitter is connected to a 20 mA input with power supply, only the two lower terminals ("+" and "-") have to be connected:

UMS Transmitter	20 mA Input
RED	"Loop(+)", respectively LOOP
BLUE	"Loop(-)", respectively LOOP RET

The two middle clamps are connected together.

They can be used to connect the power supply to the receiver when both cables are merged in the transmitter.

During normal operation, the upper LED ("Parameter") on the transmitter lights with low brightness blue or green depending on the measuring parameter.

Green: relative value (% sat)

Red: absolute value (mg / l)

The output of the oxygen value can be either absolute (mg / l) or relative to the saturation concentration (% sat). To switch the output mode, press the button on the transmitter briefly (about 1 s).

Conversion of the measured values:

Abslute value:	(lout – 4 mA) * 1.25
	( * 1 mg/l / 1 mA)
	4 mA corresponds to 0 mg/l, 20 mA corresponds to 20 mg/l.

Relative value: (lout – 4 mA) \* 12.5 (\* 1 %Sat / 1 mA) 4 mA corresponds to 0 %sat, 20 mA corresponds to 200 %sat

If an error occurs, a current of 24 mA is output, the type of error is signaled via the lower LED ("Error"):

Red:	DO value too high, sensor defective or incorrectly wired (short circuit)
Green:	DO value too low, sensor defective or incorrectly wired
Flashing red:	NTC fault, short circuit or not connected
Flashing blue:	NTC error, short circuit or not connected

# Calibration

During calibration, the sensor must be inserted in the supplied calibration chamber. In this there is a sponge, which should be kept moist.

The sensor should be powered for at least 5 minutes before calibration.

(in case of a new or recently regenerated sensor, or if the sensor has not been used for more than 2 weeks, 10-15 minutes are recommended)

# During this time and during calibration, the sensor must be in the supplied calibration chamber!

After this waiting period, the calibration is started by pressing the button on the transmitter for at least 3 seconds.

If the calibration is successful, the upper LED flashes green 3 times.

If the lower LED is flashing green, the calibration was unsuccessful.

By briefly pressing the button this can be quitted. The transmitter then continues to use the previous valid calibration values.

After successful calibration, the loop current is approximately 12.3 mA when the sensor is in the calibration chamber and the relative value output has been selected.

# Technical specifications:

Input	UMS oxygen sensor
Output	Dissolved oxygen concentration, optionally mg/I or %saturation
	Normal 420 mA
	Alarm signal: 24 mA
Power supply	6-32 VDC, min. 24 mA
Storage and operating temperature of the sensor	0 70 °C

# Measuring ranges:

Parameter	Measuring range	Accuracy
DO absolutely	0,00 19.99 mg/l	0.02 mg/l
DO relatively	0,00 199.9 %Sat	0.1 %Sat

### **Liability and warranty**

We reserve the right to make technical changes!

We assume no liability for damage caused by improper use and / or malfunction of the device.

We provide a 12-month legal guarantee on the entire measuring system.

In the guarantee case, please return the sensor or measuring instrument with the test certificate.
